PRODUCT OVERVIEW · PROJECT GUIDE

FeedbackPro AI

A customer-feedback analytics demo that brings reviews, local sentiment analysis, operational follow-up, and business reporting into one responsive workspace.

Vanilla JavaScript | Browser-based demo | Local data

What it does

Dashboard

Shows review volume, average rating, sentiment mix, and rating-based satisfaction. Date range, custom dates, and category filters recalculate the visible metrics and charts.

Feedback and reviews

Collects ratings and written reviews. Search, filter, sort, paginate, inspect review details, manage responses, and export review data as CSV.

Analytics and reports

Compares product ratings and categories, charts monthly volume and category sentiment, and summarizes category performance and negative-feedback themes. Reports export to CSV or PDF/print.

Sentiment analysis

Local rule-based analysis classifies positive, neutral, and negative language. It considers ratings, some negations and intensifiers, detects common topics and urgency phrases, and suggests a follow-up action.

Insights Copilot

Answers supported questions about reviews, ratings, products, categories, trends, and complaint themes. Responses are calculated from workspace reviews and can show sample reviews as evidence.

Complaint tracking

Creates trackable issues from negative reviews. Teams can set priority, enter an assignee, and update open, in-progress, or resolved status.

Data import

Previews CSV and Excel rows, validates ratings and required review text, flags duplicate records, and imports valid feedback into dashboard analytics.

Workspace experience

Responsive sidebar navigation, dark/light themes, notifications, profile preferences, demo login, and sample-data reset support the end-to-end demo.

How the "AI" works: Sentiment and Copilot are deterministic, in-browser rules—not a hosted generative AI model. Copilot matches questions to supported query types, calculates results from saved feedback, and displays review evidence where available. Review text is not sent to an AI provider.

WORKFLOW AND IMPLEMENTATION

How the pieces work together

1 Collect or import

Submit a review in the feedback form or preview a CSV/Excel file. Imports accept customerName, email, product, category, rating, reviewTitle, reviewText, and optional date columns. Validated reviews are saved to the browser workspace.

2 Analyze locally

Review text and its 1–5 rating are scored with a keyword lexicon. Topic terms identify delivery, support, pricing, product, and usability. Explicit urgency phrases are flagged separately.

3 Explore evidence

Dashboard and analytics aggregate the stored reviews into counts, averages, charts, and category tables. Copilot selects a supported query and returns computed values with review excerpts when applicable.

4 Take action and report

Convert negative reviews into complaints, assign owners and priorities, track resolution, respond to reviews, and export review data or business summaries.

Technology and local setup

Static HTML pages, CSS, and vanilla JavaScript; no build step or package manager is required. Feedback, preferences, demo auth state, notifications, and complaints are stored in browser LocalStorage.

HTML · CSS · JavaScript · LocalStorage · Chart.js · SheetJS · jsPDF

From the project directory, run `python3 -m http.server 8000` and open `http://localhost:8000/login.html`. Demo sign-in details are documented in the project README.

Project map

- `index.html` — dashboard views and navigation
- `feedback.html`, `login.html` — feedback form and demo auth
- `js/dashboard.js`, `js/analytics.js` — charts and aggregates
- `js/workspace.js` — Copilot, import, complaints
- `js/sentiment.js`, `js/storage.js` — analysis and persistence
- `js/reviews.js`, `js/reports.js` — review operations and exports
- `css/` — shared, responsive, and feature-specific styling

Important demo limitations: There is no backend, database, server-side authentication, tenant isolation, or configured AI provider. LocalStorage is browser-specific and is not secure or shared between users. Do not enter real passwords or sensitive customer data. Charts, Excel import, and PDF export use CDN libraries and need internet access. This project is not production-ready without server-side identity, secure APIs, and persistent database storage.
